Package 'sccore'

September 3, 2020

Title Core Utilities for Single-Cell RNA-Seq

Version 0.1.0

Description Core utilities for single-cell RNA-seq data analysis. Contains functions for manipulating and plotting data via ggplot2.

License GPL-3

Encoding UTF-8

LazyData true

Imports dplyr, ggplot2, ggrepel, graphics, grDevices, igraph, magrittr, Matrix, methods, pROC, parallel, rlang, scales, tibble, utils, uwot, withr

Suggests ggrastr (>= 0.1.7), pbapply, rmumps, testthat

RoxygenNote 7.1.1

LinkingTo Rcpp, RcppArmadillo, RcppProgress, RcppEigen

NeedsCompilation yes

URL https://github.com/kharchenkolab/sccore

BugReports https://github.com/kharchenkolab/sccore/issues

Author Peter Kharchenko [aut], Viktor Petukhov [aut], Evan Biederstedt [aut, cre]

Maintainer Evan Biederstedt <evan.biederstedt@gmail.com>

R topics documented:

`appendSpecificityMetricsToDE` *Append specificity metrics to DE*

Description

Append specificity metrics to DE

Usage

```
appendSpecificityMetricsToDE(
  de.df,
  clusters,
  cluster.id,
  p2.counts,
  low.expression.threshold = 0,
  append.auc = FALSE
)
```

Arguments

`de.df`	data.frame of differential expression values
`clusters`	factor of clusters
`cluster.id`	names of 'clusters' factor. If a cluster.id doesn't exist in cluster names, an error is thrown.
`p2.counts`	counts from Pagoda2, refer to <https://github.com/kharchenkolab/pagoda2>
`low.expression.threshold`	numeric Threshold to remove expression values (default=0). Values under this threshold are discarded.
`append.auc`	boolean If TRUE, append AUC values (default=FALSE)

Value

data.frame of differential expression values with metrics attached

---

`collapseGraphPaga` *Collapse graph using PAGA 1.2 algorithm, Wolf et al 2019, Genome Biology (2019) <https://genomebiology.biomedcentral.com/articles/10.1186/s13059-019-1663-x>*

Description

Collapse graph using PAGA 1.2 algorithm, Wolf et al 2019, Genome Biology (2019) <https://genomebiology.biomedcentr
019-1663-x>

Usage

```
collapseGraphPaga(graph, groups, linearize = TRUE, winsorize = FALSE)
```

Arguments

`graph`	igraph graph object Graph to be collapsed
`groups`	factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched)
`linearize`	should normally be always TRUE (default=TRUE)
`winsorize`	winsorize final connectivity statistics value (default=FALSE) Note: Original PAGA has it as always TRUE, but in this case there is no way to distinguish level of connectivity for highly connected groups.

Value

collapsed graph

`collapseGraphSum` *Collapse Graph By Sum*

Description

Collapse Graph By Sum

Usage

```
collapseGraphSum(graph, groups, normalize = TRUE)
```

Arguments

`graph`	igraph graph object Graph to be collapsed
`groups`	factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched)
`normalize`	boolean whether to recalculate edge weight as observed/expected (default=TRUE)

Value

collapsed graph

`colSumByFac` *Calculates factor-stratified sums for each column*

Description

Calculates factor-stratified sums for each column

Usage

```
colSumByFac(sY, rowSel)
```

Arguments

`sY`	sparse matrix (dgCmatrix)
`rowSel`	integer factor. Note that the 0-th column will return sums for any NA values; 0 or negative values will be omitted

Value

Matrix

`dotPlot` *Dot plot adapted from Seurat:::DotPlot, see ?Seurat:::DotPlot for details*

Description

Dot plot adapted from Seurat:::DotPlot, see ?Seurat:::DotPlot for details

Usage

```
dotPlot(
  markers,
  count.matrix,
  cell.groups,
  marker.colour = "black",
  cluster.colour = "black",
  xlab = "Marker",
  ylab = "Cluster",
  n.cores = 1,
  text.angle = 45,
  gene.order = NULL,
  cols = c("blue", "red"),
  col.min = -2.5,
  col.max = 2.5,
  dot.min = 0,
```

```
  dot.scale = 6,
  scale.by = "radius",
  scale.min = NA,
  scale.max = NA,
  verbose = TRUE,
  ...
)
```

Arguments

markers	Vector of gene markers to plot
count.matrix	Merged count matrix
cell.groups	Named factor containing cell groups (clusters) and cell names
marker.colour	Character or numeric vector (default="black")
cluster.colour	Character or numeric vector (default="black")
xlab	string X-axis title (default="Marker")
ylab	string Y-axis title (default="Cluster")
n.cores	integer Number of cores (default=1)
text.angle	numeric Angle of text displayed (default=45)
gene.order	Either factor of genes passed to dplyr::mutate(levels=gene.order), or a boolean. (default=NULL) If TRUE, gene.order is set to the unique markers. If FALSE, gene.order is set to NULL. If NULL, the argument is ignored.
cols	Colors to plot (default=c("blue", "red")). The name of a palette from 'RColorBrewer::brewer.pal.info', a pair of colors defining a gradient, or 3+ colors defining multiple gradients (if 'split.by' is set).
col.min	numeric Minimum scaled average expression threshold (default=-2.5). Everything smaller will be set to this.
col.max	numeric Maximum scaled average expression threshold (default=2.5). Everything larger will be set to this.
dot.min	numeric The fraction of cells at which to draw the smallest dot (default=0). All cell groups with less than this expressing the given gene will have no dot drawn.
dot.scale	numeric Scale the size of the points, similar to cex (default=6)
scale.by	string Scale the size of the points by 'size' or by 'radius' (default="radius")
scale.min	numeric Set lower limit for scaling, use NA for default (default=NA)
scale.max	numeric Set upper limit for scaling, use NA for default (default=NA)
verbose	boolean Verbose output (default=TRUE)
...	Additional inputs passed to sccore:::plapply(), see man for description.

Value

ggplot2 object

`embeddingColorsPlot` *Set colors for embedding plot. Used primarily in embeddingPlot().*

Description

Set colors for embedding plot. Used primarily in embeddingPlot().

Usage

```
embeddingColorsPlot(
  plot.df,
  colors = NULL,
  groups = NULL,
  geom_point_w = ggplot2::geom_point,
  gradient.range.quantile = 1,
  color.range = "symmetric",
  legend.title = NULL,
  palette = NULL
)
```

Arguments

`plot.df`	data.frame for plotting. In embeddingPlot(), this is a tibble from tibble::rownames_to_column().
`colors`	vector of numbers, which must be shouwn with point colors, names contain cell names (default=NULL). This argument is ignored if groups are provided.
`groups`	vector of cluster labels, names contain cell names (default=NULL)
`geom_point_w`	function to work with geom_point layer from ggplot2 (default=ggplot2::geom_point)
`gradient.range.quantile`	Winsorization quantile for the numeric colors and gene gradient (default=1)
`color.range`	controls range, in which colors are estimated (default="symmetric"). Pass "all" to estimate range based on all values of "colors", pass "data" to estimate it only based on colors, presented in the embedding. Alternatively you can pass vector of length 2 with (min, max) values.
`legend.title`	legend title (default=NULL)
`palette`	function, which accepts number of colors and return list of colors (i.e. see 'colorRampPalette') (default=NULL)

Value

ggplot2 object

`embeddingGroupPlot` *Plotting function for cluster labels, names contain cell names. Used primarily in embeddingPlot().*

Description

Plotting function for cluster labels, names contain cell names. Used primarily in embeddingPlot().

Usage

```
embeddingGroupPlot(
  plot.df,
  groups,
  geom_point_w = ggplot2::geom_point,
  min.cluster.size = 0,
  mark.groups = FALSE,
  font.size = c(3, 7),
  legend.title = NULL,
  shuffle.colors = FALSE,
  palette = NULL,
  ...
)
```

Arguments

`plot.df`	data.frame for plotting. In embeddingPlot(), this is a tibble from tibble::rownames_to_column().
`groups`	vector of cluster labels, names contain cell names (default=NULL)
`geom_point_w`	function to work with geom_point layer from ggplot2 (default=ggplot2::geom_point)
`min.cluster.size`	labels for all groups with number of cells fewer than this parameter are considered as missed (default=0). This argument is ignored if groups aren't provided
`mark.groups`	plot cluster labels above points (default=TRUE)
`font.size`	font size for cluster labels (default=c(3, 7)). It can either be single number for constant font size or pair (min, max) for font size depending on cluster size
`legend.title`	legend title (default=NULL)
`shuffle.colors`	shuffle colors (default=FALSE)
`palette`	function, which accepts number of colors and return list of colors (i.e. see 'colorRampPalette') (default=NULL)
`...`	Additional arguments passed to ggplot2::geom_label_repel()

Value

ggplot2 object

`embeddingPlot` *Plot embedding with provided labels / colors using ggplot2*

Description

Plot embedding with provided labels / colors using ggplot2

Usage

```
embeddingPlot(
  embedding,
  groups = NULL,
  colors = NULL,
  subgroups = NULL,
  plot.na = is.null(subgroups),
  min.cluster.size = 0,
  mark.groups = TRUE,
  show.legend = FALSE,
  alpha = 0.4,
  size = 0.8,
  title = NULL,
  plot.theme = NULL,
  palette = NULL,
  color.range = "symmetric",
  font.size = c(3, 7),
  show.ticks = FALSE,
  show.labels = FALSE,
  legend.position = NULL,
  legend.title = NULL,
  gradient.range.quantile = 1,
  raster = FALSE,
  raster.width = NULL,
  raster.height = NULL,
  raster.dpi = 300,
  shuffle.colors = FALSE,
  keep.limits = !is.null(subgroups),
  ...
)
```

Arguments

`embedding`	two-column matrix with x and y coordinates of the embedding, rownames contain cell names and are used to match coordinates with groups or colors
`groups`	vector of cluster labels, names contain cell names (default=NULL)
`colors`	vector of numbers, which must be shouwn with point colors, names contain cell names (default=NULL). This argument is ignored if groups are provided.
`subgroups`	subset of 'groups', selecting the cells for plot (default=NULL). Ignored if 'groups' is NULL
`plot.na`	boolean whether to plot points, for which groups / colors are missed (default=FALSE). This argument is FALSE if 'subgroups' is NULL

`min.cluster.size`
: labels for all groups with number of cells fewer than this parameter are considered as missed (default=0). This argument is ignored if groups aren't provided

`mark.groups`
: plot cluster labels above points (default=TRUE)

`show.legend`
: show legend (default=FALSE)

`alpha`
: opacity level [0, 1] (default=0.4)

`size`
: point size (default=0.8)

`title`
: plot title (default=NULL)

`plot.theme`
: theme for the plot (default=NULL)

`palette`
: function, which accepts number of colors and return list of colors (i.e. see 'colorRampPalette') (default=NULL)

`color.range`
: controls range, in which colors are estimated (default="symmetric"). Pass "all" to estimate range based on all values of "colors", pass "data" to estimate it only based on colors, presented in the embedding. Alternatively you can pass vector of length 2 with (min, max) values.

`font.size`
: font size for cluster labels (default=c(3, 7)). It can either be single number for constant font size or pair (min, max) for font size depending on cluster size

`show.ticks`
: show ticks and tick labels (default=FALSE)

`show.labels`
: show labels (default=FALSE)

`legend.position`
: vector with (x, y) positions of the legend (default=NULL)

`legend.title`
: legend title (default=NULL)

`gradient.range.quantile`
: Winsorization quantile for the numeric colors and gene gradient (default=1)

`raster`
: boolean whether layer with the points be rasterized (default=FALSE). Setting of this argument to TRUE is useful when you need to export a plot with large number of points

`raster.width`
: width of the plot in inches. (default=NULL). Ignored if raster == FALSE.

`raster.height`
: height of the plot in inches. (default=NULL). Ignored if raster == FALSE.

`raster.dpi`
: dpi of the rasterized plot. (default=300). Ignored if raster == FALSE.

`shuffle.colors`
: shuffle colors (default=FALSE)

`keep.limits`
: Keep axis limits from original plot (default=!is.null(subgroups)). Useful when plotting subgroups, only meaningful it plot.na=FALSE

`...`
: Arguments passed on to `ggrepel::geom_label_repel`

  `mapping` Set of aesthetic mappings created by `aes` or `aes_`. If specified and `inherit.aes = TRUE` (the default), is combined with the default mapping at the top level of the plot. You only need to supply `mapping` if there isn't a mapping defined for the plot.

  `data` A data frame. If specified, overrides the default data frame defined at the top level of the plot.

  `stat` The statistical transformation to use on the data for this layer, as a string.

  `position` Position adjustment, either as a string, or the result of a call to a position adjustment function.

  `parse` If TRUE, the labels will be parsed into expressions and displayed as described in ?plotmath

box.padding Amount of padding around bounding box, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x,"units")).

label.padding Amount of padding around label, as unit or number. Defaults to 0.25. (Default unit is lines, but other units can be specified by passing unit(x,"units")).

point.padding Amount of padding around labeled point, as unit or number. Defaults to 0. (Default unit is lines, but other units can be specified by passing unit(x,"units")).

label.r Radius of rounded corners, as unit or number. Defaults to 0.15. (Default unit is lines, but other units can be specified by passing unit(x,"units")).

label.size Size of label border, in mm.

segment.colour Colour of the line segment. Defaults to the same colour as the text. In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

segment.color Colour of the line segment. Defaults to the same colour as the text. In the unlikely event you specify both US and UK spellings of colour, the US spelling will take precedence.

segment.size Width of line segment connecting the data point to the text label, in mm.

segment.alpha Transparency of the line segment. Defaults to the same transparency as the text.

min.segment.length Skip drawing segments shorter than this, as unit or number. Defaults to 0.5. (Default unit is lines, but other units can be specified by passing unit(x,"units")).

arrow specification for arrow heads, as created by arrow

force Force of repulsion between overlapping text labels. Defaults to 1.

max.iter Maximum number of iterations to try to resolve overlaps. Defaults to 2000.

nudge_x Horizontal and vertical adjustments to nudge the starting position of each text label.

nudge_y Horizontal and vertical adjustments to nudge the starting position of each text label.

xlim Limits for the x and y axes. Text labels will be constrained to these limits. By default, text labels are constrained to the entire plot area.

ylim Limits for the x and y axes. Text labels will be constrained to these limits. By default, text labels are constrained to the entire plot area.

na.rm If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.

direction "both", "x", or "y" – direction in which to adjust position of labels

seed Random seed passed to set.seed. Defaults to NA, which means that set.seed will not be called.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. borders.

Value

ggplot2 object

`embedGraphUmap` *Embed a graph into a UMAP, Uniform Manifold Approximation and Projection for Dimension Reduction, <https://github.com/lmcinnes/umap>*

Description

Embed a graph into a UMAP, Uniform Manifold Approximation and Projection for Dimension Reduction, <https://github.com/lmcinnes/umap>

Usage

```
embedGraphUmap(
  graph,
  min.prob = 0.001,
  min.visited.verts = 1000,
  n.cores = 1,
  max.hitting.nn.num = 0,
  max.commute.nn.num = 0,
  min.prob.lower = 1e-07,
  n.neighbors = 40,
  n.epochs = 1000,
  spread = 15,
  min.dist = 0.001,
  return.all = FALSE,
  n.sgd.cores = n.cores,
  verbose = TRUE,
  ...
)
```

Arguments

`graph`	input igraph object
`min.prob`	numeric Minimum probability for proximity when calculating hitting time per neighbors (default=1e-3)
`min.visited.verts`	numeric Minimum number of vertices visted when calculating hitting time per neighbors (default=1000)
`n.cores`	numeric Number of cores to use (default=1)
`max.hitting.nn.num`	numeric Maximum adjacencies for calculating hitting time per neighbor, hitting_time_per_neighbors() (default=0)
`max.commute.nn.num`	numeric Maximum adjacencies for calculating commute time per neighbor, commute_time_per_node() (default=0)
`min.prob.lower`	numeric Probability threshold to continue iteration in depth first search hitting time, dfs_hitting_time() (default=1e-7)
`n.neighbors`	numeric Number of neighbors (default=40)

n.epochs	numeric Number of epochs to use during the optimization of the embedded coordinates (default=1000). See 'n_epochs' in uwot::umap()
spread	numeric The effective scale of embedded points (numeric default=15). See 'spread' in uwot::umap()
min.dist	numeric The effective minimum distance between embedded points (default=0.001). See 'min.dist' in uwot::umap()
return.all	boolean If TRUE, return list(adj.info=adj.info, commute.times=commute.times, umap=umap). Otherwise, just return UMAP(default=FALSE)
n.sgd.cores	numeric Number of cores to use during stochastic gradient descent. If set to > 1, then results will not be reproducible, even if 'set.seed' is called with a fixed seed before running (default=n_threads) See 'n_sgd_threads' in uwot::umap()
verbose	boolean Verbose output (default=TRUE)
...	Additional arguments passed to embedKnnGraph()

Value

result

`embedKnnGraph` *Embed a k-nearest neighbor (kNN) graph witin a UMAP. Used within embedGraphUmap()*

Description

Embed a k-nearest neighbor (kNN) graph witin a UMAP. Used within embedGraphUmap()

Usage

```
embedKnnGraph(
  commute.times,
  n.neighbors,
  names = NULL,
  n.cores = 1,
  n.epochs = 1000,
  spread = 15,
  min.dist = 0.001,
  n.sgd.cores = n.cores,
  target.dims = 2,
  verbose = TRUE,
  ...
)
```

Arguments

commute.times	graph commute times from get_nearest_neighbors(). The definition of commute_time(u, v) is the expected time starting at u = to reach v and then return to u .
n.neighbors	numeric Number of neighbors
names	vector of names for UMAP rownames (default=NULL)

n.cores	numeric Number of cores to use (except during stochastic gradient descent) (default=1). See 'n_threads' in uwot::umap()
n.epochs	numeric Number of epochs to use during the optimization of the embedded coordinates (default=1000). See 'n_epochs' in uwot::umap()
spread	numeric The effective scale of embedded points (numeric default=15). See 'spread' in uwot::umap()
min.dist	numeric The effective minimum distance between embedded points (default=0.001). See 'min.dist' in uwot::umap()
n.sgd.cores	numeric Number of cores to use during stochastic gradient descent. If set to > 1, then results will not be reproducible, even if 'set.seed' is called with a fixed seed before running (default=n.cores) See 'n_sgd_threads' in uwot::umap()
target.dims	numeric Dimensions for 'n_components' in uwot::umap(n_components=target.dims) (default=2)
verbose	boolean Verbose output (default=TRUE)
...	arguments passed to uwot::umap()

Value

result

`extendMatrix` *Extend matrix to include new columns in matrix*

Description

Extend matrix to include new columns in matrix

Usage

```
extendMatrix(mtx, col.names)
```

Arguments

mtx	Matrix
col.names	Columns that should be included in matrix

Value

Matrix with new columns

`fac2col` *Utility function to translate a factor into colors*

Description

Utility function to translate a factor into colors

Usage

```
fac2col(
  x,
  s = 1,
  v = 1,
  shuffle = FALSE,
  min.group.size = 1,
  return.details = FALSE,
  unclassified.cell.color = "gray50",
  level.colors = NULL
)
```

Arguments

`x`	input factor
`s`	numeric The "saturation" to be used to complete the HSV color descriptions (default=1) See ?rainbow in Palettes, grDevices
`v`	numeric The "value" to be used to complete the HSV color descriptions (default=1) See ?rainbow in Palettes, grDevices
`shuffle`	boolean If TRUE, shuffles columns with shuffle(columns) (default=FALSE)
`min.group.size`	integer Exclude groups of size less than the min.group.size (default=1)
`return.details`	boolean If TRUE, returns a list list(colors=y, palette=col). Otherwise, just returns the factor (default=FALSE)
`unclassified.cell.color`	Color for unclassified cells (default='gray50')
`level.colors`	(default=NULL)

Value

vector or list of colors

Examples

```
genes = factor(c("BRAF", "NPC1", "PAX3", "BRCA2", "FMR1"))
fac2col(genes)
```

`fac2palette` *Encodes logic of how to handle named-vector and functional palettes. Used primarily within embeddingGroupPlot()*

Description

Encodes logic of how to handle named-vector and functional palettes. Used primarily within embeddingGroupPlot()

Usage

```
fac2palette(groups, palette, unclassified.cell.color = "gray50")
```

Arguments

`groups`	vector of cluster labels, names contain cell names
`palette`	function, which accepts number of colors and return list of colors (i.e. see 'colorRampPalette')
`unclassified.cell.color`	Color for unclassified cells (default='gray50')

Value

vector or palette

`findSubcommunities` *Increase resolution for a specific set of clusters*

Description

Increase resolution for a specific set of clusters

Usage

```
findSubcommunities(
  con,
  target.clusters,
  clustering = NULL,
  groups = NULL,
  method = igraph::cluster_louvain,
  ...
)
```

Arguments

con	conos object, from <https://github.com/kharchenkolab/conos>, "Joint analysis of heterogeneous single-cell RNA-seq dataset collections", DOI: 10.1038/s41592-019-0466-z
target.clusters	Clusters for which the resolution should be increased
clustering	Name of clustering in the conos object to use (default=NULL). Either 'clustering' or 'groups' must be provided.
groups	Set of clusters to use (default=NULL). Ignored if 'clustering' is not NULL.
method	Function, used to find communities (default=igraph::cluster_louvain)
...	Additional params passed to the community function

---

getClusterGraph *Collapse vertices belonging to each cluster in a graph*

Description

Collapse vertices belonging to each cluster in a graph

Usage

```
getClusterGraph(
  graph,
  groups,
  method = "sum",
  plot = FALSE,
  node.scale = 50,
  edge.scale = 50,
  edge.alpha = 0.3,
  seed = 1,
  ...
)
```

Arguments

graph	igraph graph object Graph to be collapsed
groups	factor on vertices describing cluster assignment (can specify integer vertex ids, or character vertex names which will be matched)
method	string Method to be used, either "sum" or "paga" (default="sum")
plot	boolean Whether to show collapsed graph plot (default=FALSE)
node.scale	numeric Scaling to control value of 'vertex.size' in plot.igraph() (default=50)
edge.scale	numeric Scaling to control value of 'edge.width' in plot.igraph() (default=50)
edge.alpha	numeric Scaling to control value of 'alpha.f' in adjustcolor() within plot.igraph() (default=0.3)
seed	numeric Set seed via set.seed() for plotting (default=1)
...	arguments passed to collapseGraphSum()

Value

collapsed graph

`get_nearest_neighbors` *Get nearest neighbors method on graph*

Description

Get nearest neighbors method on graph

Usage

```
get_nearest_neighbors(
  adjacency_list,
  transition_probabilities,
  n_verts = 0L,
  n_cores = 1L,
  min_prob = 0.001,
  min_visited_verts = 1000L,
  min_prob_lower = 1e-05,
  max_hitting_nn_num = 0L,
  max_commute_nn_num = 0L,
  verbose = TRUE
)
```

Arguments

`adjacency_list`	igraph adjacency list
`transition_probabilities`	vector of transition probabilites
`n_verts`	numeric Number of vertices (default=0)
`n_cores`	numeric Number of cores to use (default=1)
`min_prob`	numeric Minimum probability for proximity when calculating hitting time per neighbors (default=1e-3)
`min_visited_verts`	numeric Minimum number of vertices visted when calculating hitting time per neighbors (default=1000)
`min_prob_lower`	numeric Probability threshold to continue iteration in depth first search hitting time, dfs_hitting_time() (default=1e-5)
`max_hitting_nn_num`	numeric Maximum adjacencies for calculating hitting time per neighbor, hitting_time_per_neighbors() (default=0)
`max_commute_nn_num`	numeric Maximum adjacencies for calculating commute time per neighbor, commute_time_per_node() (default=0)
`verbose`	boolean Verbose output

Value

list of commute times based on adjacencies

graphToAdjList *Convert igraph graph into an adjacency list*

Description

Convert igraph graph into an adjacency list

Usage

```
graphToAdjList(graph)
```

Arguments

graph	input igraph object

Value

adjacency list, defined by list(idx=adj.list, probabilities=probs, names=edge.list.fact$levels

jsDist *Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence) between the columns of a dense matrix m*

Description

Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence) between the columns of a dense matrix m

Usage

```
jsDist(m, ncores = 1L)
```

Arguments

m	Input matrix
ncores	integer Number of cores (default=1)

Value

Vectorized version of the lower triangle as an R distance object, stats::dist()

mergeCountMatrices *Merge into a common matrix, entering 0s for the missing entries*

Description

Merge into a common matrix, entering 0s for the missing entries

Merge list of count matrices

Usage

```
mergeCountMatrices(cms, transposed = FALSE, ...)

mergeCountMatrices(cms, transposed = FALSE, ...)
```

Arguments

cms	List of count matrices
transposed	boolean Indicate whether 'cms' is transposed, e.g. cells in rows and genes in columns (default=FALSE)
...	Parameters for 'plapply' function

Value

A merged extended matrix, with 0s for missing entries

Mrged matrix

multi2dend *Translate multilevel segmentation into a dendrogram, with the lowest level of the dendrogram listing the cells*

Description

Translate multilevel segmentation into a dendrogram, with the lowest level of the dendrogram listing the cells

Usage

```
multi2dend(cl, counts, deep = FALSE, dist = "cor")
```

Arguments

cl	igraph communities object, returned from igraph community detection functions
counts	dgCmatrix of counts
deep	boolean If TRUE, take (cl$memberships[1,]). Otherwise, uses as.integer(membership(cl)) (default=FALSE)
dist	Distance metric used (default='cor'). Eiether 'cor' for the correlation distance in log10 space, or 'JS' for the Jensen–Shannon distance metric (i.e. the square root of the Jensen–Shannon divergence)

Value

result

`plapply` *Parallel, optionally verbose lapply. See ?parallel::mclapply for more info.*

Description

Parallel, optionally verbose lapply. See ?parallel::mclapply for more info.

Usage

```
plapply(
  ...,
  progress = FALSE,
  n.cores = parallel::detectCores(),
  mc.preschedule = FALSE
)
```

Arguments

`...`	Additional arguments passed to mclapply(), lapply(), or pbapply::pblapply()
`progress`	Show progress bar via pbapply (default=FALSE)
`n.cores`	Number of cores to use (default=parallel::detectCores())
`mc.preschedule`	See ?parallel::mclapply (default=FALSE) If TRUE then the computation is first divided to (at most) as many jobs are there are cores and then the jobs are started, each job possibly covering more than one value. If FALSE, then one job is forked for each value of X. The former is better for short computations or large number of values in X, the latter is better for jobs that have high variance of completion time and not too many values of X compared to mc.cores.

Value

list, as returned by lapply

Examples

```
square = function(x){ x**2 }
plapply(1:10, square, n.cores=1, progress=TRUE)
```

propagateLabels *Estimate labeling distribution for each vertex, based on provided labels.*

Description

Estimate labeling distribution for each vertex, based on provided labels.

Usage

```
propagateLabels(graph, labels, method = "diffusion", ...)
```

Arguments

graph	igraph graph object
labels	vector of factor or character labels, named by cell names, used in propagateLabelsSolver() and propagateLabelsDiffusion()
method	string Type of propagation. Either 'diffusion' or 'solver'. (default='diffusion') 'solver' gives better result but has bad asymptotics, so it is inappropriate for datasets > 20k cells.
...	additional arguments passed to either propagateLabelsSolver() or propagateLabelsDiffusion()

Value

matrix with distribution of label probabilities for each vertex by rows.

propagateLabelsDiffusion *Estimate labeling distribution for each vertex, based on provided labels using Random Walk*

Description

Estimate labeling distribution for each vertex, based on provided labels using Random Walk

Usage

```
propagateLabelsDiffusion(
  graph,
  labels,
  max.iters = 100,
  diffusion.fading = 10,
  diffusion.fading.const = 0.1,
  tol = 0.025,
  fixed.initial.labels = TRUE,
  verbose = TRUE
)
```

Arguments

graph	igraph graph object Graph input
labels	vector of factor or character labels, named by cell names
max.iters	integer Maximal number of iterations. (default=100)
diffusion.fading	(default=10.0)
diffusion.fading.const	(default=0.1)
tol	numeric Absolute tolerance as a stopping criteria. (default=0.025)
fixed.initial.labels	prohibit changes of initial labels during diffusion. (default=TRUE)
verbose	boolean Verbose mode. (default=TRUE)

Value

matrix

---

propagateLabelsSolver *Propagate labels using Zhu, Ghahramani, Lafferty (2003) algorithm <http://mlg.eng.cam.ac.uk/zoubin/papers/zgl.pdf>*

Description

Propagate labels using Zhu, Ghahramani, Lafferty (2003) algorithm <http://mlg.eng.cam.ac.uk/zoubin/papers/zgl.pdf>

Usage

```
propagateLabelsSolver(graph, labels, solver = "mumps")
```

Arguments

graph	igraph graph object Graph input
labels	vector of factor or character labels, named by cell names
solver	Method of solver to use (default="mumps"), either "Matrix" or "mumps" (i.e. "rmumps::Rmumps")

Value

result from Matrix::solve() or rmumps::Rmumps

setMinMax — *Set range for values in object. Changes values outside of range to min or max. Adapted from Seurat::MinMax*

Description

Set range for values in object. Changes values outside of range to min or max. Adapted from Seurat::MinMax

Usage

```
setMinMax(obj, min, max)
```

Arguments

obj	Object to manipulate
min	Minimum value
max	Maximum value

Value

An object with the same dimensions as input but with altered range in values

Examples

```
example_matrix =  matrix(rep(c(1:5), 3), 5)
setMinMax(example_matrix, 2, 4)
```

sn — *Set names equal to values, a stats::setNames wrapper function*

Description

Set names equal to values, a stats::setNames wrapper function

Usage

```
sn(x)
```

Arguments

x	an object for which names attribute will be meaningful

Value

An object with names assigned equal to values

Examples

```
vec = c(1, 2, 3, 4)
sn(vec)
```

splitVectorByNodes *splitVectorByNodes*

Description

splitVectorByNodes

Usage

```
splitVectorByNodes(vec, nodes, n.nodes)
```

Arguments

vec	input vector to be divided
nodes	nodes used to divide the vector 'vec' via split()
n.nodes	numeric The number of nodes for splitting

Value

list from vec with names given by the nodes

styleEmbeddingPlot *Set plot.theme, legend, ticks for embedding plot. Used primarily in embeddingPlot().*

Description

Set plot.theme, legend, ticks for embedding plot. Used primarily in embeddingPlot().

Usage

```
styleEmbeddingPlot(
  gg,
  plot.theme = NULL,
  title = NULL,
  legend.position = NULL,
  show.legend = TRUE,
  show.ticks = TRUE,
  show.labels = TRUE,
  relabel.axis = TRUE
)
```

Arguments

gg	ggplot2 object to plot
plot.theme	theme for the plot (default=NULL)
title	plot title (default=NULL)
legend.position	vector with (x, y) positions of the legend (default=NULL)
show.legend	show legend (default=TRUE)
show.ticks	show ticks and tick labels (default=TRUE)
show.labels	show labels (default=TRUE)
relabel.axis	boolean If TRUE, relabel axes with ggplot2::labs(x='Component 1', y='Component 2') (default=TRUE)

Value

ggplot2 object

---

val2ggcol *Helper function to return a ggplot color gradient for a numeric vector ggplot(aes(color=x, ...), ...) + val2ggcol(x)*

Description

Helper function to return a ggplot color gradient for a numeric vector ggplot(aes(color=x, ...), ...) + val2ggcol(x)

Usage

```
val2ggcol(
  values,
  gradient.range.quantile = 1,
  color.range = "symmetric",
  palette = NULL,
  midpoint = NULL,
  oob = scales::squish,
  return.fill = FALSE,
  ...
)
```

Arguments

values	values by which the color gradient is determined
gradient.range.quantile	numeric Trimming quantile (default=1). Either a single number or two numbers - for lower and upper quantile.
color.range	either a vector of two values explicitly specifying the values corresponding to the start/end of the gradient, or string "symmetric" or "all" (default="symmetric"). "symmetric": range will fit data, but will be symmetrized around zeros, "all": gradient will match the span of the range of the data (after gradient.range.quantile)

palette	an optional palette fucntion (default=NULL). The default becomes blue-gray90-red; if the values do not straddle 0, then truncated gradients (blue-gray90 or gray90-red) will be used
midpoint	optional midpoint (default=NULL). Set for the center of the resulting range by default
oob	function to determine what to do with the values outside of the range (default =scales::squish). Refer to 'oob' parameter in ggplot
return.fill	boolean Whether to return fill gradients instead of color (default=FALSE)
...	additional arguments are passed to ggplot2::scale_color_gradient* functions, i.e. scale_color_gradient(), scale_color_gradient2(), scale_color_gradientn()

Value

ggplot2::scale_colour_gradient* object
